[illegible]

through target in an early manner the feasibility of future work in identifying and manipulating factors which appear to be involved in the pathogenesis of the disease. It is also possible that the use of these models will lead to the identification of genes that determine susceptibility to the disease, with the possibility that all genes in the genome will be screened for the identification of those genes that are involved in the pathogenesis of the disease. This approach is also possible for the identification of genes that are involved in the pathogenesis of the disease. This approach is also possible for the identification of genes that are involved in the pathogenesis of the disease.
